SEACOMMONS

From observation to accountable evidence.

A public-interest maritime intelligence platform.

THE QUESTION

What can we actually know about events at sea?

The sea produces fragmented signals. A position, radio message or report is not a verified incident.

THE METHOD

Collect. Compare. Verify.

SeaCommons brings together AIS, public reports, humanitarian alerts, satellite observations and radio metadata. Every finding keeps its provenance and uncertainty.

THE PIPELINE

From a signal to an assessed episode.

Observation, normalisation, correlation, episode, assessment and publication review. Each stage has a different meaning.

THE TWO FIELDS

Humanitarian and maritime intelligence.

Humanitarian research examines distress, rescue and search-and-rescue context. Maritime intelligence examines vessel activity and operational patterns. Both require independent corroboration.

THE PRODUCTS

One infrastructure, different views.

LIVE presents current privacy-filtered cases. PLAY provides historical dossiers. FUTURES explains operations, research, documentation and development. The API provides structured data contracts.

CURRENT CHALLENGES

Reliability is part of the evidence.

The engineering register tracks passenger-vessel false positives, AIS disconnects, disk growth, stale caches and release validation. A merged fix is not proof of production closure.

THE NEXT LAYER

Sensors: extending observation at sea.

Coastal AIS and radio receivers, environmental stations, recoverable GNSS drifters and resilient compute could strengthen independent observations. These are proposed pilots, not an installed global network.

THE PRINCIPLE

Evidence that can be questioned.

SeaCommons is built to show sources, contradictions, confidence and limits. The goal is more accountable understanding, not automatic certainty.
